Port scanner using python code :

```
import socket

def scan_ports(target, start_port, end_port):
    print(f"\nScanning target: {target}")
    print("======================================")

    try:
        target_ip = socket.gethostbyname(target)
    except socket.gaierror:
        print("Invalid hostname!")
        return

    open_ports = []
    closed_ports = 0

    for port in range(start_port, end_port + 1):
        s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
        s.settimeout(0.5)

        result = s.connect_ex((target_ip, port))

        if result == 0:
            print(f"Port {port}: OPEN")
            open_ports.append(port)
        else:
```

```
            closed_ports += 1

        s.close()

    print("========================================")
    print("Scan completed.\n")
    print(f"Total ports scanned: {end_port - start_port + 1}")
    print(f"Open ports: {len(open_ports)}")
    print(f"Closed ports: {closed_ports}")

    if open_ports:
        print("Open Port List:", open_ports)

target = input("Enter target (IP or domain): ")
start_port = int(input("Enter start port: "))
end_port = int(input("Enter end port: "))

scan_ports(target, start_port, end_port)
```
